ON A CONTINUED FRACTION OF ORDER TWELVE

ПРО ЛАНЦЮГОВИЙ ДРІБ ДВАНАДЦЯТОГО ПОРЯДКУ

We present some new relations between a continued fraction $U(q)$ of order twelve (which is established by M. S. M. Naika et al.) and $U(q^n)$ for $n = 7, 9, 11$ and 13 .

Наведено деякі нові спiввiдношення мiж ланцюговим дробом $U(q)$ дванадцятого порядку (який описано М. С. М. Найка та іншими авторами) i $U(q^n)$ для $n = 7, 9, 11$ та 13 .

1. Introduction. Throughout the paper, we assume $|q| < 1$ and for a positive integer n , we use the standard notation

$$(a)_0 := (a; q)_0 = 1,$$

$$(a)_n := (a; q)_n = \prod_{i=0}^{n-1} (1 - aq^i)$$

and

$$(a)_\infty := (a; q)_\infty = \prod_{n=0}^{\infty} (1 - aq^n).$$

In Chapter 16 of his Second Notebook [12, p. 197; 3, p. 34] S. Ramanujan develops the theory of theta functions and his theta function is defined by

$$f(a, b) := \sum_{n=-\infty}^{\infty} a^{\frac{n(n+1)}{2}} b^{\frac{n(n-1)}{2}} = (-a; ab)_\infty (-b; ab)_\infty (ab; ab)_\infty, \quad |ab| < 1.$$

Following Ramanujan [12, p. 197], we define

$$\phi(q) := f(q, q) = 1 + 2 \sum_{k=1}^{\infty} q^{k^2} = \frac{(-q; -q)_\infty}{(q; -q)_\infty},$$

$$\psi(q) := f(q, q^3) = \sum_{k=0}^{\infty} q^{\frac{k(k+1)}{2}} = \frac{(q^2; q^2)_\infty}{(q; q^2)_\infty}$$

and

$$f(-q) := f(-q, -q^2) = \sum_{k=-\infty}^{\infty} (-1)^k q^{\frac{k(3k-1)}{2}} = (q; q)_\infty.$$

For convenience, we denote

$$f(-q^n) = f_n.$$

The celebrated Rogers – Ramanujan continued fraction is defined as

$$R(q) := \frac{q^{1/5}f(-q, -q^4)}{f(-q^2, -q^3)} = \frac{q^{1/5}}{1} + \frac{q}{1} + \frac{q^2}{1} + \frac{q^3}{1} + \dots . \quad (1.1)$$

On p. 365 of his Lost Notebook [13], Ramanujan recorded five identities, which shows the relations between $R(q)$ and five continued fractions $R(-q)$, $R(q^2)$, $R(q^3)$, $R(q^4)$ and $R(q^5)$. He also recorded these identities at the scattered places of his Notebooks [12]. L. J. Rogers [14] found the modular equations relating $R(q)$ and $R(q^n)$ for $n = 2, 3, 5$ and 11 , the latter equations is not found in Ramanujan's works. For a proof of these, one may refer [4]. Recently K. R. Vasuki and S. R. Swamy [19] found the modular equation relating $R(q)$ with $R(q^7)$.

The Ramanujan's cubic continued fraction $G(q)$ be defined by

$$G(q) := \frac{q^{1/3}f(-q, -q^5)}{f(-q^3, -q^3)} = \frac{q^{1/3}}{1} + \frac{q+q^2}{1} + \frac{q^2+q^4}{1} + \frac{q^3+q^6}{1} + \dots . \quad (1.2)$$

The continued fraction (1.2) was first introduced by Ramanujan in his second letter to G. H. Hardy [10]. He also recorded the continued fraction (1.2) on p. 365 of his Lost Notebook [13] and claims that there are many results of $G(q)$ which are analogous to the famous Rogers–Ramanujan continued fraction (1.1).

Motivated by Ramanujan's claim H. H. Chan [5], N. D. Baruah [1], K. R. Vasuki and B. R. Srivatsakumar [18] have established the modular relations between $G(q)$ and $G(q^n)$ for $n = 2, 3, 5, 7, 11$ and 13 .

The Ramanujan Göllnitz–Gordon continued fraction [13, p. 44; 8; 9] is defined by

$$H(q) := \frac{q^{1/2}f(-q^3, -q^5)}{f(-q, -q^7)} = \frac{q^{1/2}}{1} + \frac{q^2}{1+q^3} + \frac{q^4}{1+q^5} + \dots . \quad (1.3)$$

Chan and S. S. Hang [6], K. R. Vasuki and B. R. Srivatsakumar [17] have established the identities which gives the relations between $H(q)$ and $H(q^n)$ with $n = 3, 4, 5, 11$ by employing the modular equations stated by Ramanujan. Recently B. Cho, J. K. Koo and Y. K. Park [7] have extended the above results on continued fraction (1.3) to all odd primes p by computing the affine models of modular curves $X(\Gamma)$ with $\Gamma = \Gamma_1(8) \cap \Gamma_0(16p)$.

Motivated by the above works on the continued fractions (1.1)–(1.3), in this paper, we establish the relation between the following continued fraction $U(q)$ with $U(q^n)$ for $n = 2, 7, 9, 11$ and 13

$$U(q) := \frac{qf(-q, -q^{11})}{f(-q^5, -q^7)} = \\ \frac{q(1-q)}{(1-q^3)} + \frac{q^3(1-q^2)(1-q^4)}{(1-q^3)(1+q^6)} + \frac{q^3(1-q^8)(1-q^{10})}{(1-q^3)(1+q^{12})} + \dots . \quad (1.4)$$

The continued fraction (1.4) was established by M. S. M. Naika et al. [11] as a particular case of fascinating continued fraction identity recorded by Ramanujan in his Second Notebook [12, p. 74]. Furthermore they have also established the modular relation between the continued fraction $U(q)$ with $U(q^n)$ with $n = 3$ and 5 .

2. Some preliminary results.

Theorem 2.1 [11]. *We have*

$$\frac{\phi(q)}{\phi(q^3)} = \frac{1+U(q)}{1-U(q)}. \quad (2.1)$$

Theorem 2.2. *We have*

$$\frac{\phi^2(-q)}{\phi^2(-q^3)} = 1 - \frac{4U(q)}{1+U^2(q)}. \quad (2.2)$$

Proof. From [2], we have

$$(\phi^2(q) + \phi^2(q^3))^2 = \frac{4\phi(q^3)\phi^3(-q^3)\phi(q)}{\phi(-q)}, \quad (2.3)$$

and also from [16], we have

$$(3\phi^2(q^3) - \phi^2(q))^2 = \frac{4\phi(q^3)\phi(q)\phi^3(-q)}{\phi(-q^3)}. \quad (2.4)$$

From (2.3) and (2.4), we deduce that

$$\frac{\phi^2(-q)}{\phi^2(-q^3)} = \frac{3 - \frac{\phi^2(q)}{\phi(q^3)}}{1 + \frac{\phi^2(q)}{\phi^2(q^3)}}.$$

Employing (2.1) in the right-hand side of the above identity, we obtain (2.2).

Theorem 2.3. *We have*

$$\frac{\psi^2(q^2)}{q\psi^2(q^6)} = U(q) + \frac{1}{U(q)} - 1. \quad (2.5)$$

Proof. From [2], we obtain

$$1 - \frac{\phi^2(-q)}{\phi^2(-q^3)} = \frac{4qf_1f_{12}^3}{f_4f_3^3}, \quad (2.6)$$

and also from [2], we have

$$1 + \frac{\psi^2(q^2)}{q\psi^2(q^6)} = \frac{f_3^3f_4}{qf_1f_{12}^3}.$$

Using (2.6) and the above identity, we find that

$$1 + \frac{\psi^2(q^2)}{q\psi^2(q^6)} = \frac{4}{1 - \frac{\phi^2(-q)}{\phi^2(-q^3)}},$$

which upon using (2.2) gives the required result.

Theorem 2.4. *We have*

$$\frac{\psi^2(q)}{q^{1/2}\psi^2(q^3)} = \frac{1+U(q)}{1-U(q)} \sqrt{U(q) + \frac{1}{U(q)} - 1}. \quad (2.7)$$

Proof. Consider,

$$\frac{\psi^4(q)}{q\psi^4(q^3)} = \frac{\phi^2(q)\psi^2(q^2)}{q\phi^2(q^3)\psi^2(q^6)} \quad (2.8)$$

where, we have used the identity $\phi(q)\psi(q^2) = \psi^2(q)$ from Entry 25 [3, p. 40]. Now using (2.1) and (2.7) in the right-hand side of the above, we obtain the required result.

Theorem 2.5. *We have*

$$\frac{\psi^4(-q)}{q\psi^4(-q^3)} = \left[\frac{U^2(q) + 1}{U(q)} + \frac{4U(q)}{1 + U^2(q)} - 5 \right]. \quad (2.9)$$

Proof. Changing q to $-q$ in (2.8) and then using (2.2) and (2.5) on the right-hand side of (2.8), we obtain (2.9).

To prove our main results, we require following easily deducible identities:

$$\begin{aligned} \phi(q) &= \frac{f_2^5}{f_1^2 f_4^2}, & \psi(q) &= \frac{f_2^2}{f_1}, \\ \phi(-q) &= \frac{f_1^2}{f_2}, & \psi(-q) &= \frac{f_1 f_4}{f_2}, \\ f(q) &= \frac{f_2^3}{f_1 f_4}, & \chi(q) &= \frac{f_2^2}{f_1 f_4} \end{aligned}$$

and

$$\chi(-q) = \frac{f_1}{f_2}. \quad (2.10)$$

And also the following identities analogous to Rogers–Ramanujan forty identities:

Theorem 2.6 [15]. *Let*

$$M(q) = \frac{f(-q^5, -q^7)}{f_4}$$

and

$$N(q) = \frac{f(-q, -q^{11})}{f_4}.$$

Then

$$M(q^2)N(q) + qM(q)N(q^2) = \frac{f_3 f_{24}}{f_4 f_8}, \quad (2.11)$$

$$M(q^2)N(q) - qM(q)N(q^2) = \frac{f_1^2 f_6 f_{24}}{f_2 f_3 f_4 f_8}, \quad (2.12)$$

$$M(q^3)N(q) + q^2 M(q)N(q^3) = \frac{f_1 f_6^5 f_9 f_{36}}{f_2^2 f_3^2 f_{12}^3 f_{18}}, \quad (2.13)$$

$$M(q^3)N(q) - q^2 M(q)N(q^3) = \frac{f_1 f_{18}^2}{f_4 f_9 f_{12}}, \quad (2.14)$$

$$M(q^5)N(q) - q^4 M(q)N(q^5) = \frac{f_1 f_6^2 f_{30}}{f_2 f_3 f_{12} f_{20}} \quad (2.15)$$

and

$$M(q)M(q^5) - q^6 N(q)N(q^5) = \frac{f_5 f_6 f_{30}^2}{f_4 f_{10} f_{15} f_{60}}. \quad (2.16)$$

A proof of (2.11)–(2.16) can be found in [15].

3. Main results. In this section, we derive the relation between the continued fraction $U(q)$ with $U(q^n)$ for $n = 2, 3, 5, 7, 9, 11$ and 13.

Theorem 3.1. Let $u := U(q)$ and $v := U(q^2)$. Then

$$u^2 - v + 2uv - u^2v + v^2 = 0.$$

Proof. By (1.4), we have

$$U(q) = \frac{qN(q)}{M(q)}. \quad (3.1)$$

Dividing (2.11) by (2.12) and on using (2.10), we obtain

$$\frac{M(q^2)N(q) + qM(q)N(q^2)}{M(q^2)N(q) - qM(q)N(q^2)} = \frac{\varphi(-q^3)}{\varphi(-q)}.$$

Squaring on both sides of the above identity and using (3.1) on the left-hand side and (2.2) on the right-hand side of the above identity and then dividing throughout by $4u$, we deduce the required result.

Theorem 3.2 [11]. Let $u = U(q)$ and $v = U(q^3)$. Then

$$u^3 - v^3 + v^2 - v + 3uv - 3u^2v^2 + u^3v^2 - u^3v = 0.$$

Proof. Dividing (2.14) by (2.13) and on using (2.10), we find that

$$\frac{M(q^3)N(q) - q^2 M(q)N(q^3)}{M(q^3)N(q) + q^2 M(q)N(q^3)} = \frac{\phi(-q^2)\phi(-q^3)\phi(-q^{18})}{\phi(-q^6)\phi(-q^9)\phi(-q^6)}.$$

Squaring on both sides of the above identity, and using (3.1) on the left-hand side and employing the identity

$$\phi(q)\phi(-q) = \phi^2(-q^2)$$

on the right-hand side of the above, we obtain

$$\left(\frac{U(q) - U(q^3)}{U(q) + U(q^3)} \right)^2 = \frac{\phi(q)}{\phi(q^3)} \frac{\phi(-q)}{\phi(-q^3)} \frac{\phi(-q^3)}{\phi(-q^9)} \frac{\phi(q^9)}{\phi(q^3)}.$$

Squaring again on both sides of the above, employing (2.1) and (2.2) on the right-hand side of the above identity and then factorizing using maple, we deduce that

$$\begin{aligned} & 8(-v^3 + v^2 - v + 3uv - 3u^2v^2 + u^3v^2 - u^3v + u^3) \times \\ & \times (u^5v - u^4v^3 + u^4v^2 - 3u^4v + 5u^3v^3 - u^3v^2 - u^3v + u^3 - u^2v^5 + u^4v^2 + \end{aligned}$$

$$+u^2v^3 - 5u^2v^2 + 3v^4u - uv^3 + uv^2 - v^4) = 0.$$

Now, from the definition of u and v , we have

$$u = U(q) = 1 - q + q^5 - q^6 + q^7 + \dots \quad (3.2)$$

and

$$v = U(q^3) = 1 - q^3 + q^{15} - q^{18} + q^{21} + \dots$$

Using (3.2) and the above in the above factors, we see that the first factor becomes

$$q^3(3 - 6q + 3q^2 - 3q^3 + 6q^4 + 3q^5 - 9q^6 + \dots),$$

and the second factor becomes

$$-q^3(10 - 22q + 15q^2 - 22q^3 + 33q^4 - 9q^5 + \dots).$$

Thus the second factor does not vanish. Hence by the identity Theorem, we must have

$$v^3 - v^2 + v - 3uv + 3u^2v^2 - u^3v^2 + u^3v - u^3 = 0.$$

Theorem 3.2 is proved.

Theorem 3.3 [11]. *Let $u := U(q)$ and $v := U(q^5)$. Then*

$$\begin{aligned} & uv^6 - u^6v^5 + 5u^5v^5 - 5u^4v^5 - 5uv^5 + 10v^4u^3 + 5uv^4 - 10u^4v^3 - 10u^2v^3 + \\ & + 5u^5v^2 + 10u^3v^2 - 5u^5v - 5u^2v + 5uv - v + u^5 = 0. \end{aligned}$$

Proof. Dividing (2.15) by (2.16) and using (2.10), we find that

$$\frac{M(q^5)N(q) - q^4M(q)N(q^5)}{M(q)M(q^5) - q^6N(q)N(q^5)} = \frac{q\psi(-q)}{\psi(-q^3)} \frac{\psi(-q^{15})}{\psi(-q^5)}.$$

Taking power 4 on both sides of the above and employing (2.9) on the right-hand side of the above and then factorizing using Maple, we deduce that

$$\begin{aligned} & (u^2 + u^2v^2 + 1 - 4uv + v^2)(uv^6 - u^6v^5 + 5u^5v^5 - 5u^4v^5 - 5uv^5 + 10v^4u^3 + 5uv^4 - \\ & - 10u^4v^3 - 10u^2v^3 + 5u^5v^2 + 10u^3v^2 - 5u^5v - 5u^2v + 5uv - v + u^5) = 0. \end{aligned}$$

Changing q to q^5 in (3.2), we find that

$$v = U(q^5) = 1 - q^5 + q^{25} - q^{30} + q^{35} + \dots$$

Using (3.2) and the above in the above factors, we see that the first factor becomes

$$q^2(2 - 4q^4 + 2q^5 - 4q^6 + 4q^8 - 2q^9 + 3q^{10} + \dots),$$

and the second factor becomes

$$-q^7(40 - 40q + 20q^2 + 10q^3 - 55q^4 + 110q^5 - 180q^6 + \dots).$$

Thus the first factor does not vanish. Hence by the identity theorem, we must have

$$\begin{aligned} & uv^6 - u^6v^5 + 5u^5v^5 - 5u^4v^5 - 5uv^5 + 10v^4u^3 + 5uv^4 - 10u^4v^3 - 10u^2v^3 + \\ & + 5u^5v^2 + 10u^3v^2 - 5u^5v - 5u^2v + 5uv - v + u^5 = 0. \end{aligned}$$

Theorem 3.3 is proved.

Theorem 3.4. Let $u = U(q)$ and $v = U(q^7)$. Then

$$\begin{aligned}
 & 7u^3v^2 - 35u^3v^4 - 7u^3v - 7u^3v^3 + 35u^4v^3 - u^7 + \\
 & + 7u^5v - 7u^6v + 7u^7v - 28u^5v^2 + 28u^6v^2 - 14v^2u^7 + 7v^3u^5 - 7v^3u^6 + \\
 & + 7v^3u^7 - 35v^4u^5 + 7v^5u - 7v^5u^2 + 7v^5u^3 + 35v^5u^4 - 7v^5u^5 + 28v^5u^6 - \\
 & - 7v^5u^7 - 14v^6u + 28v^6u^2 - 28v^6u^3 + 7v^6u^5 - 28v^6u^6 + 7v^6u^7 + 7v^7u - \\
 & - 7v^7u^2 + 7v^7u^3 - 7v^7u^5 + 14v^7u^6 - 7v^7u^7 + v^7u^8 - v^8u + v - 7uv + \\
 & + 7uv^2 + 14u^2v - 28u^2v^2 - 7uv^3 + 28u^2v^3 = 0.
 \end{aligned}$$

Proof. If

$$P = \frac{\phi(q)}{\phi(q^3)}$$

and

$$Q = \frac{\phi(q^7)}{\phi(q^{21})},$$

then

$$\begin{aligned}
 & \left(\frac{Q}{P}\right)^4 - \left(\frac{P}{Q}\right)^4 + 14 \left[\left(\frac{Q}{P}\right)^2 - \left(\frac{P}{Q}\right)^2 \right] = \\
 & (PQ)^3 + \frac{27}{(PQ)^3} + 7 \left(PQ + \frac{3}{PQ} \right) \left[1 - \left(\frac{P}{Q}\right)^2 - \left(\frac{Q}{P}\right)^2 \right]. \quad (3.3)
 \end{aligned}$$

We have deduced the identity (3.3) on the lines remarked by N. D. Baruah [1]. Now employing (2.1) in (3.3), we deduce the required result.

Theorem 3.5. Let $u = U(q)$ and $v = U(q^9)$, then

$$\begin{aligned}
 & 9u^4v + 126u^4u - 90uv^3 + 27v^8u^3 + v - 9vu + 45v^2u + 378u^7v^5 + \\
 & + 135u^8v^4 + 54u^8v^2 - 9u^8v + 18u^7v + 558v^4u^6 - 558v^5u^3 + 561v^4u^3 - 10u^9v^2 - \\
 & - 333u^6v^3 + 4u^9v - 561u^6v^5 + 16u^9v^3 - 19u^9v^4 + 369v^5u^2 - \\
 & - 99u^5v^2 - 378v^4u^2 + 135v^7u^2 + 99uv^6 + 16u^9v^5 + 333u^3v^6 + \\
 & + 243u^7v^3 - 243u^2v^6 - 126u^8v^5 - 27u^6v - 54v^7u + 9v^8u - 135u^7v^2 + \\
 & + 10v^3 - 198v^6u^4 + 369u^4v^5 - 16v^6 + 19v^5 - 16v^4 - u^9 - 4v^8 + \\
 & + 10v^7 - 243v^4u^4 - 153v^2u^2 + 99v^7u^4 + 297v^3u^2 + 9u^8v^8 + 243u^5v^5 -
 \end{aligned}$$

$$\begin{aligned}
& -18v^8u^2 - 297v^6u^7 + 30u^6v^8 + 153v^7u^7 - 30vu^3 - 165v^7u^3 + 198u^5v^3 - \\
& - 99u^8v^3 - 423v^3u^3 - 9u^4v^8 - 369u^7v^4 + 165u^6v^2 + \\
& + 423u^6v^6 - 153u^5v^6 - 171u^6v^7 - 369u^5v^4 - 9u^5v^8 + 54u^5v^7 + \\
& + 27vu^2 + 90u^8v^6 + v^9 + 9u^5v - 10u^9v^6 - 45u^8v^7 + 171v^2u^3 + 153v^3u^4 + \\
& + 4u^9v^7 - 4v^2 - 27u^7v^8 - 54u^4v^2 - u^9v^8 - 135v^5u = 0.
\end{aligned}$$

Proof. Let $w = U(q^3)$ then, by Theorem 3.2, we have

$$u^3 - w^3 + w^2 - w + 3uw - 3u^2w^2 + u^3w^2 - u^3w = 0. \quad (3.4)$$

Changing q to q^3 in (3.4), we obtain

$$w^3 - v^3 + v^2 - v + 3wv - 3w^2v^2 + w^3v^2 - w^3v = 0. \quad (3.5)$$

Now eliminating w between (3.4) and (3.5), we deduce the required result.

Theorem 3.6. Let $u = U(q)$ and $v = U(q^{11})$, then

$$\begin{aligned}
& -363v^7u^{10} - 528v^{10}u^8 + 11v^{10}u^{11} - 1089v^9u^8 + 1463v^4u^8 - 1012v^7u^8 + \\
& + 11v^{11}u^2 + vu - 968v^4u^4 + 44v^3u - 374v^3u^2 + 77v^4u - \\
& - 528v^4u^2 - 11vu^2 - 363v^5u^2 + 55v^7u^{11} + v^{11}u^{11} + \\
& + 759v^7u^9 + 55v^5u + 55v^1u^7 - 759v^3u^7 - 55v^7u + \\
& + 363v^7u^2 - 77v^8u + 528v^8u^2 + 176v^{10}u^2 + \\
& + 44v^{11}u^9 + 363v^2u^5 - 44vu^9 - 11v^2u^{11} - 11v^{10}u + \\
& + 528v^{10}u^4 + 528v^4u^{10} + 374v^9u^2 - 44v^9u - \\
& - 110v^2u^2 + 11v^2u + 77vu^8 + 374v^3u^{10} - 363v^2u^7 - \\
& - 77vu^4 + 11vu^{10} + 1089v^4u^3 - 374v^9u^{10} + \\
& + 44vu^3 - 759v^9u^5 + 55vu^5 + 759v^5u^3 + \\
& + 363v^5u^{10} + 1012v^5u^8 - 1012v^5u^4 - 55vu^7 + 1496v^5u^5 - \\
& - 759v^5u^9 - 528v^2u^4 - 704v^5u^7 - 55v^5u^{11} - 968v^8u^8 + \\
& + 1463v^8u^4 + 1089v^3u^8 - 528v^8u^{10} - 1089v^3u^4 - \\
& - 1089v^8u^3 - 1012v^8u^5 + 1496v^7u^7 + 77v^8u^{11} +
\end{aligned}$$

$$\begin{aligned}
& +1089v^8u^9 - 363v^{10}u^5 + 1012v^8u^7 + u^{12} - 374v^2u^9 + \\
& +1023v^3u^3 - 110v^{10}u^{10}1012v^7u^4 - 704v^7u^5 - 77v^{11}u^8 + \\
& +1012v^4u^5 + 11vu^{11} - 44v^{11}u^3 - 1012v^4u^7 + 924v^6u^6 + \\
& +1089v^9u^4 + 1023v^9u^9 - 759v^7u^3 + 759v^3u^5 + 44v^9u^{11} + \\
& +528v^2u^8 + 759v^9u^7 - 803v^3u^9 - 44v^3u^{11} + 363v^{10}u^7 + \\
& +1089v^4u^9 + 11v^{11}u + 374v^2u^3 - 77v^4u^{11} + 77v^{11}u^4 + 374v^{10}u^9 - \\
& -55v^{11}u^5 + v^{12} - 374v^{10}u^3 - 11v^{11}u^{10} - 803v^9u^3 + 176v^2u^{10} = 0.
\end{aligned}$$

Proof. Let

$$P = \frac{\varphi(q)}{\varphi(q^3)}$$

and

$$Q = \frac{\varphi(q^{11})}{\varphi(q^{33})},$$

then from [18], we have

$$\begin{aligned}
& (PQ)^5 + \frac{3^5}{(PQ)^5} - 11 \left[(PQ)^3 + \frac{3^3}{(PQ)^3} \right] + 308 \left[PQ + \frac{3}{PQ} \right] = \\
& = \left(\frac{P}{Q} \right)^6 + \left(\frac{Q}{P} \right)^6 + 22 \left[\left(\frac{P}{Q} \right)^4 + \left(\frac{Q}{P} \right)^4 \right] \left[3 - \left(PQ + \frac{3}{PQ} \right) \right] + \\
& + 11 \left[\left(\frac{P}{Q} \right)^2 + \left(\frac{Q}{P} \right)^2 \right] \left[(PQ)^3 + \frac{3^3}{(PQ)^3} - 15 \left(PQ + \frac{3}{PQ} \right) + 45 \right] + 924.
\end{aligned}$$

Using (2.1) in the above, we deduce the required result.

Theorem 3.7. *Let $u = U(q)$ and $v = U(q^{13})$, then*

$$\begin{aligned}
& -8346u^8v^5 + 611u^{11}v^{12} + 6318u^4v^8 + 8723u^8v^6 - 8346u^5v^8 - 78u^7v^5 + \\

& - 91u^{10}v + 52u^{12}v + 4407u^3v^4 - 13u^{11}v + 8476u^5v^6 - 481u^{11}v^2 - 1378u^{12}v^{10} - \\
& - 1170u^8v^{12} + 78u^8v^{13} + 4706u^8v^{11} - 182u^5v - 13uv^{11} + 195uv^9 - 91uv^{10} - \\
& - 65u^{13}v^{11} - uv - 39u^2v^{12} - 481u^2v^{11} - 26uv^{13} - 1170u^2v^6 + 52uv^{12} - \\
& - 1911u^2v^9 + 1846u^9v^{12} + 910u^4v^7 - 6331u^9v^{11} - 13u^{13}v^3 + 2652u^{11}v^3 - \\
& - 481u^{12}v^3 - 182u^9v^{13} + 52u^{13}v^2 + 195u^5v^{13} + 1313u^2v^{10} - 39u^{12}v^2 - \\
& - 6331u^3v^5 - 5317u^{11}v^4 + 1313u^{12}v^4 - 12909u^5v^5 - 78u^5v^7 = 0.
\end{aligned}$$

Proof. Let $P = \frac{\varphi(q)}{\varphi(q^3)}$ and $Q = \frac{\varphi(q^{13})}{\varphi(q^{39})}$, then from [18], we have

$$\begin{aligned}
& \left(\frac{Q}{P}\right)^7 + \left(\frac{P}{Q}\right)^7 + 13 \left[\left(\frac{P}{Q}\right)^6 + \left(\frac{Q}{P}\right)^6 \right] - 26 \left[\left(\frac{P}{Q}\right)^5 + \left(\frac{Q}{P}\right)^5 \right] - \\
& - 13 \left[3(PQ)^2 + \frac{27}{(PQ)^2} + 10 \right] \left[\left(\frac{Q}{P}\right)^4 + \left(\frac{P}{Q}\right)^4 \right] + 13 \left[10(PQ)^2 + \frac{90}{(PQ)^2} + 68 \right] \times \\
& \times \left[\left(\frac{Q}{P}\right)^3 + \left(\frac{P}{Q}\right)^3 \right] + 13 \left[10(PQ)^2 + \frac{90}{(PQ)^2} + 68 \right] \left[\left(\frac{Q}{P}\right)^3 + \left(\frac{P}{Q}\right)^3 \right] + \\
& + 13 \left[(PQ)^4 + \frac{81}{(PQ)^4} - 20 \left((PQ)^2 + \frac{9}{(PQ)^2} \right) - 115 \right] \left[\left(\frac{Q}{P}\right)^2 + \left(\frac{P}{Q}\right)^2 \right] - \\
& - 13 \left[(PQ)^4 + \frac{81}{(PQ)^4} - 10 \left((PQ)^2 + \frac{9}{(PQ)^2} \right) - 131 \right] \left[\left(\frac{Q}{P}\right) + \left(\frac{P}{Q}\right) \right] = \\
& = (PQ)^6 + \frac{729}{(PQ)^6} - 26 \left[(PQ)^4 + \frac{81}{(PQ)^4} \right] + 169 \left[(PQ)^2 + \frac{9}{(PQ)^2} \right] + 832.
\end{aligned}$$

Now using (2.1) in the above identity, we deduce the required result.
