ON THE PROPER POSEDNESS OF TWO-POINT BOUNDARY-VALUE PROBLEM FOR SYSTEM WITH PSEUDODIFFERENTIAL OPERATORS

ПРО КОРЕКТНІСТЬ ДВОТОЧКОВОЇ КРАЙОВОЇ ЗАДАЧІ ДЛЯ СИСТЕМ ІЗ ПСЕВДОДИФЕРЕНЦІАЛЬНИМИ ОПЕРАТОРАМИ

The question on the proper posedness of boundary-value problem with nonlocal condition for a system of pseudodifferential equations of an arbitrary order is investigated. The equation and the boundary conditions contain the pseudodifferential operators which symbols are defined and continuous in some domain $H \subset \mathbb{R}^{m}_{\sigma}$. The criterion of the existence, uniqueness of solutions and of the continuously dependence of the solution on the boundary function is established.

Розглянуто питання про коректність крайової задачі з нелокальною умовою для системи псевдодиференціальних рівнянь довільного порядку. Рівняння та граничні умови містять псевдодиференціальні оператори із символами, що визначені та неперервні у деякій області $H \subset$

⊂ \mathbb{R}_{σ}^{m} . Встановлено критерій існування та єдиності розв'язків, а також неперервної залежності розв'язку від граничної функції.

1. Introduction. The present paper generalizes and evolves the results of works [1, 2]. It investigates the question of the proper posedness of nonlocal boundary-value problem for system of equations, containing the pseudodifferential operators that symbols are defined and continuous in some domain $H \subset \mathbb{R}^m$. The solution of the problem is sought in functional spaces.

Consider in the infinite layer $\Pi = \mathbb{R}^m \times [0, T]$ the following two-point boundary problem

$$L\left(\frac{\partial}{\partial t}, -i\frac{\partial}{\partial x}\right)u(x, t) = \frac{\partial u}{\partial t} + P\left(-i\frac{\partial}{\partial x}\right)u = 0, \qquad (1)$$

$$M\left(-i\frac{\partial}{\partial x}\right)u(x,t) = A\left(-i\frac{\partial}{\partial x}\right)u(x,0) + B\left(-i\frac{\partial}{\partial x}\right)u(x,T) = \varphi(x)$$
(2)

where

$$\frac{\partial}{\partial x} = \left(\frac{\partial}{\partial x_1}, \frac{\partial}{\partial x_2}, \dots, \frac{\partial}{\partial x_m}\right), \quad u = \operatorname{col}(u_1, u_2, \dots, u_m),$$
$$\varphi(x) = \operatorname{col}(\varphi_1(x), \varphi_2(x), \dots, \varphi_m(x));$$
$$P\left(-i\frac{\partial}{\partial x}\right) = \left\|P_{jk}\left(-i\frac{\partial}{\partial x}\right)\right\|_{j,k=\overline{1,l}}, \quad A\left(-i\frac{\partial}{\partial x}\right) = \left\|A_{jk}\left(-i\frac{\partial}{\partial x}\right)\right\|_{j,k=\overline{1,l}},$$
$$B\left(-i\frac{\partial}{\partial x}\right) = \left\|B_{jk}\left(-i\frac{\partial}{\partial x}\right)\right\|_{j,k=\overline{1,l}},$$

matrices that elements are pseudodifferential operators with symbols $P(\sigma)$, $A(\sigma)$, and $B(\sigma)$, respectively, continuous in some domain $H \subset \mathbb{R}^m_{\sigma}$.

Generally speaking, problem (1), (2) is improperly posed, even if $P_{jk}(\sigma)$, $A_{jk}(\sigma)$, and $B_{ik}(\sigma)$ are polynomials [3-6].

We shall be concerned with the question of the existence and uniqueness of solution

1131

ISSN 1027-3190. Укр. мат. журн., 2005, т. 57, № 8

of problem (1), (2), and the question of the continuously dependence of this solution on the boundary function $\varphi(x)$.

2. Notations and definitions. For the description of the spaces of solutions, we introduce the following notation:

 W_{Ω}^{∞} is the space of vector-functions $u(x) = (u_1(x), u_2(x), \dots, u_l(x)), u_j(x) \in L_2(\mathbb{R}^m)$, such that the Fourier transform $\hat{u}_j(\sigma)$ is compactly supported in $\Omega \subset \mathbb{R}_{\sigma}^{\infty}$; the space W_{Ω}^{∞} is invariant relatively to the pseudodifferential operator $\tilde{A}\left(-\frac{\partial}{\partial x}\right)$

$$\left(\tilde{A}\left(-i\frac{\partial}{\partial x}\right)u(x) = (2\pi)^{-m}\int_{\Omega}\tilde{A}(\sigma)\hat{u}(\sigma)\exp(ix\sigma)d\sigma, \quad u(x)\in W_{\Omega}^{\infty}\right)$$

with the matrix $\hat{A}(\sigma)$ continuous in Ω , moreover, $\tilde{A}\left(-i\frac{\partial}{\partial x}\right)$: $W_{\Omega}^{\infty} \to W_{\Omega}^{\infty}$ is a continuous application; $(W_{\Omega}^{\infty})'$ is the space of generalized vector-functions on W_{Ω}^{∞} ; this space is invariant relatively to $\hat{A}\left(i\frac{\partial}{\partial x}\right)$; $W_{\Omega}^{+\infty} = (W_{\Omega}^{\infty})'$, $W_{\Omega}^{-\infty} = (W_{-\Omega}^{\infty})'$, where $-\Omega = \{\sigma \in \mathbb{R}^m : -\sigma \in \Omega\}; C^k([0, T], W_{\Omega}^{\pm\infty})$ are spaces of vector-functions that for every $t \in [0, T]$ are functions of space $W_{\Omega}^{\pm\infty}$ respectively and continuously depend on t together with the derivatives up to order k.

According to I. G. Petrovski [7], introduce the following definition:

Definition. We say that problem (1), (2) is properly posed in $C^n([0,T], W_{\Omega}^{\pm\infty})$ if, for every boundary function $\varphi(x) \in W_{\Omega}^{\pm\infty}$, problem (1), (2) should have in $C^n([0,T], W_{\Omega}^{\pm\infty})$ one and only one solution u(x,t), continuously depending on $\varphi(x)$.

We shall not be concerned with Cauchy problem (the proper posedness of the Cauchy problem for equation (1) is studied in [7]).

3. On the proper posedness of problem (1), (2). It is easily seen that the following two applications for every domain $\Omega \subset H$ are continuous:

$$L\left(\frac{\partial}{\partial t}, -i\frac{\partial}{\partial x}\right): \quad C^{n}([0, T], W_{\Omega}^{\pm\infty}) \to C^{0}([0, T], W_{\Omega}^{\pm\infty}),$$
$$u \mapsto \frac{\partial u(x, t)}{\partial t} + P\left(-i\frac{\partial}{\partial x}\right)u(x, t)$$

and

$$M\left(-i\frac{\partial}{\partial x}\right): \quad C^{n}([0,T], W_{\Omega}^{\pm\infty}) \to C^{0}([0,T], W_{\Omega}^{\pm\infty}),$$
$$u \mapsto A\left(-i\frac{\partial}{\partial x}\right)u(x,0) + B\left(-i\frac{\partial}{\partial x}\right)u(x,T).$$

Let us prove the inverse.

If we denote by $\hat{u}(\sigma, t)$ and $\hat{\varphi}(\sigma)$ the *x*-Fourier transforms of the solution u(x, t) of problem (1), (2) and the boundary function $\varphi(x)$, respectively, it is easily seen that

ISSN 1027-3190. Укр. мат. журн., 2005, т. 57, № 8

 $\hat{u}(\sigma, t)$ is a solution of the following boundary-value problem:

$$L\left(\frac{d}{dt},\sigma\right)\hat{u}(\sigma,t) = \frac{d\hat{u}(\sigma,t)}{dt} + P(\sigma)\hat{u}(\sigma,t),$$
(3)

$$M(\sigma)\hat{u}(\sigma,t) = A(\sigma)\hat{u}(\sigma,0) + B(\sigma)\hat{u}(\sigma,T) = \hat{\varphi}(\sigma).$$
(4)

Let us find the fundamental matrix of solutions $F(\sigma, t)$ of system (3). Because $P(\sigma)$ is a matrix continuous in H, the roots of characteristic equation

$$\det \|I\lambda + P(\sigma)\| = 0$$

are continuous functions of parameter σ . We denote by $\chi_i = \chi_i(\sigma)$ the multiplicity of the root $\lambda_j = \lambda_j(\sigma)$, $j = \overline{1, \nu}$, $\nu = \nu(\sigma)$. According to the theory of matrices [8], there exist two polynomial matrices $M(\lambda, \sigma)$ and $N(\lambda, \sigma) = \left\| N_{jk}(\lambda, \sigma) \right\|_{i \ k=1}$ such that $M(\lambda, \sigma) \times L(\lambda, \sigma) \times N(\lambda, \sigma) \equiv Q(\lambda, \sigma) \equiv \left\| h_j(\lambda, \sigma) \delta_{jk} \right\|_{j,k=\overline{1,l}}, \quad \det N(\lambda, \sigma) \equiv Q(\lambda, \sigma) = Q(\lambda, \sigma)$ $\equiv N(\sigma) \neq 0, \text{ where } h_j(\lambda, \sigma) = \prod_{k=1}^{\nu} (\lambda - \lambda_k)^{q_{jk}(\sigma)}, j = \overline{1, l}, \text{ where } \sum_{j=1}^{l} q_{jk}(\sigma) = 0$ = $\chi_k(\sigma)$, $k = \overline{1, l}$, and δ_{ik} are the Kronecker symbols.

It follows from the equality $M(\lambda, \sigma) \times L(\lambda, \sigma) \times N(\lambda, \sigma) \equiv Q(\lambda, \sigma)$ and condition det $N(\lambda, \sigma) \equiv N(\sigma) \neq 0$ that $M(\lambda, \sigma) \times L(\lambda, \sigma) \equiv Q(\lambda, \sigma) \times N^{-1}(\lambda, \sigma)$, and after using the transformation $y(\sigma, t) = N^{-1} \left(\frac{d}{dt}, \sigma\right) \hat{u}(\sigma, t)$, system (3) takes the form

$$Q\left(\frac{d}{dt},\sigma\right)y(\sigma,t) = 0,$$

that is,

$$h_j\left(\frac{d}{dt},\sigma\right)y_j(\sigma,t) = 0, \quad j = \overline{1,l}.$$
(5)

The fundamental system of solutions of each of equations (5) reads as

$$y_{j,k\alpha}(\sigma,t) = \left(\frac{d}{d\lambda}\right)^{\alpha-1} \exp(\lambda t) \bigg|_{\lambda=\lambda_k}, \quad \alpha = \overline{1, q_{jk}(\sigma)}, \quad k = \overline{1, \nu}.$$

Therefore, the fundamental matrix of solutions of system (3) reads as

$$F(\sigma, t) = \left\| \exp(\lambda_k t) \times (\alpha - 1)! \times \sum_{s=0}^{\alpha - 1} \frac{t^s}{s!} \frac{1}{\rho!} \left(\frac{d}{d\lambda} \right)^p N_{j\beta}(\lambda, \sigma) \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, q_{\beta k}, \\ k = \overline{1, \nu, \rho = \alpha - 1 - s}}} \right\|_{\lambda = \lambda_k} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, l}, \alpha = \overline{1, \mu, \rho = \alpha - 1 - s}}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \overline{1, \mu = \alpha - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s}} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - 1 - s} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta = \alpha - 1 - s - s - 1 - s} \right\|_{\lambda = \lambda_k} \left\| \sum_{\substack{j, \beta$$

Using the theorem of dependence of solutions on the parameter [9], we conclude that $F(\sigma, t)$ is continuous with respect to σ .

Therefore, the solution of system (3) reads as $\hat{u}(\sigma, t) = F(\sigma, t)C$, where C = $= col(C_1, C_2, ..., C_l)$. Using the boundary condition (4), we find that C is a solution of the following linear algebraic system

$$(A(\sigma)F(\sigma,0) + B(\sigma)F(\sigma,T))C = \hat{\varphi}(\sigma),$$

whose determinant is

$$\Delta(\sigma) = \det D(\sigma) = \det \|A(\sigma)F(\sigma,0) + B(\sigma)F(\sigma,T)\|$$

where

ISSN 1027-3190. Укр. мат. журн., 2005, т. 57, № 8

1133

E. KENGNE

$D(\sigma) = A(\sigma)F(\sigma, 0) + B(\sigma)F(\sigma, T).$

Let $\Omega = H \setminus N_{\Delta}$, $N_{\Delta} = \{ \sigma \in \mathbb{R}^m : \Delta(\sigma) = 0 \}$. For every $\sigma \in \Omega$, $C = C(\sigma) = D^{-1}(\sigma) \times \hat{\varphi}(\sigma)$ and the solution of problem (3), (4) reads as $\hat{u}(\sigma, t) = F(\sigma, t) \times D^{-1}(\sigma) \hat{\varphi}(\sigma)$ ($\forall \sigma \in \Omega$). Let $W(\sigma, t) = F(\sigma, t) \times D^{-1}(\sigma)$.

Associate with matrix $W(\sigma, t)$ the pseudodifferential operator $W\left(-i\frac{\partial}{\partial x}, t\right)$ that acts continuously from $W_{\Omega}^{\pm\infty}$ respectively to $C^{n}([0, T], W_{\Omega}^{\pm\infty})$, that is,

$$W\left(-i\frac{\partial}{\partial x},t\right): \quad W_{\Omega}^{\pm\infty} \to C^{n}([0,T], W_{\Omega}^{\pm\infty}), \quad u(x) \mapsto W\left(-i\frac{\partial}{\partial x},t\right)u(x)$$

is a continuous application on $W_{\Omega}^{\pm\infty}$.

Theorem. In order that problem (1), (2) should be properly posed in $C^n([0, T], W_0^{\pm\infty})$, it is necessary and sufficient that $\Omega = H \setminus N_{\Lambda}$.

Proof. It is clear that $\Omega \subset H$. We prove the theorem in the case of $C^n([0, T], W_{\Omega}^{+\infty})$ (the case of $C^n([0, T], W_{\Omega}^{-\infty})$ can be done by analogy with [8]).

Necessity. If $\sigma_0 \in \Omega \cap N_{\Delta}$, the homogeneous problem

$$L\left(\frac{d}{dt},\sigma_0\right)\hat{u}(\sigma_0,t) = 0,$$

$$M(\sigma_0)\hat{u}(\sigma_0, t) = A(\sigma_0)\hat{u}(\sigma_0, 0) + B(\sigma_0)\hat{u}(\sigma_0, T) = 0$$

possesses more than one solution. Consequently, the solution (if it exists) of the homogeneous problem

$$L\left(\frac{\partial}{\partial t}, -i\frac{\partial}{\partial x}\right)u(x, t) = 0,$$
$$M\left(-i\frac{\partial}{\partial x}\right)u(x, t) = A\left(-i\frac{\partial}{\partial x}\right)u(x, 0) + B\left(-i\frac{\partial}{\partial x}\right)u(x, T) = 0$$

is not unique in $C^n([0, T], W_{\Omega}^{+\infty})$, and this implies the nonuniqueness of solutions of problem (1), (2) in $C^n([0, T], W_{\Omega}^{+\infty})$. The ill-posedness of problem (1), (2) in $C^n([0, T], W_{\Omega}^{+\infty})$ follows from the nonuniqueness of its solution in $C^n([0, T], W_{\Omega}^{+\infty})$.

Sufficiency. Let $\Omega = H \setminus N_{\Lambda}$. For every $\varphi(x) \in W_{\Omega}^{+\infty}$,

$$u(x,t) = W\left(-i\frac{\partial}{\partial x},t\right)\varphi(x)$$

is a solution of problem (1), (2) in $C^n([0, T], W_{\Omega}^{+\infty})$ and continuously depends on $\varphi(x)$, which implies the existence of solution of problem (1), (2) in $C^n([0, T], W_{\Omega}^{+\infty})$ that continuously depends on $\varphi(x)$. In order to prove the uniqueness of solution of problem (1), (2), let us notice that if $u(x, t) \in C^n([0, T], W_{\Omega}^{+\infty})$, its *x*-Fourier transform $\hat{u}(\sigma, t)$ will be a solution of problem (3), (4). Under the condition of the theorem, this problem (3), (4) possesses one and only one solution for every $\sigma \in \Omega$. If $\sigma \in \mathbb{R}^m \setminus \Omega$, then $\tilde{u}(\sigma, t) \equiv 0$. This implies the uniqueness of solution of problem (1), (2) in $C^n([0, T], W_{\Omega}^{+\infty})$, and the theorem is proved.

4. Application. Consider an infinite set of point-like particles, disposed on a string

ISSN 1027-3190. Укр. мат. журн., 2005, т. 57, № 8

at the same distances l from each other; the mass of each particle is m, while F is the tension of the string. The values of F and m are supposed to be constant everywhere and independent of time. Particles are supposed to have only one degree of freedom. At each given time t, the motion of the j-th particle is completely defined in terms of the position of its adjacent particles, i.e., the (j - 1)-th and (j + 1)-th ones $(j = 0, \pm 1, \pm 2, ...)$. Thus, the fundamental law of dynamics is given by

$$\ddot{v}_n(t) = \frac{a^2}{4} \left(v_{n+1}(t) + v_{n-1}(t) - 2v_n(t) \right), \quad n = 0, \pm 1, \pm 2, \dots,$$
(6)

being $a = 2\sqrt{\frac{F}{ml}}$. We associate with (6) the boundary conditions

$$v_n(0) + v_n(T) = \varphi_n,$$

 $\dot{v}_n(0) + \dot{v}_n(T) = \psi_n.$
(7)

Consider the differentiable function v(x, t) that takes the values of v_j at the nodes of the lattice, i.e., $v(jl, t) = v_j(t)$. Therefore, system (6) acquires the form of the difference-differential equation

$$\frac{\partial^2 v(x,t)}{\partial t^2} = \frac{a^2}{4} [v(x+l,t) - 2v(x,t) + v(x-l,t)], \quad 0 < t < T.$$
(8)

After using the equality $e^{i\left(-i2\frac{\partial}{\partial x}\right)}v(x,t) = v(x+l,t)$, equation (8) takes the form of the pseudodifferential equation:

$$\frac{\partial^2 v}{\partial t^2} + a^2 \sin^2 \left(-i \frac{\partial}{\partial x} \right) v = 0, \quad 0 < t < T.$$
(9)

By setting $u = col(u_1, u_2)$ with $u_1 = v$ and $u_2 = \frac{\partial v}{\partial t}$, equation (9) and the boundary conditions (7) become

$$\frac{\partial u}{\partial t} + P\left(-i\frac{\partial}{\partial x}\right)u = 0, \qquad (10)$$

$$u_1(x,0) + u_1(x,T) = \theta_1(x),$$

$$u_2(x,0) + u_2(x,T) = \theta_2(x),$$
(11)

respectively, where

$$P\left(-i\frac{\partial}{\partial x}\right) = \begin{pmatrix} 0 & -1 \\ a^2 \sin^2\left(-i\frac{\partial}{\partial x}\right) & 0 \end{pmatrix}$$

and $\theta_1(x)$ and $\theta_2(x)$ are two differentiable functions that take the values of φ_n and ψ_n , respectively, at the nodes of the lattice. For this example, $F(\sigma, t)$ reads as

$$F(\sigma, t) = \begin{pmatrix} \cos(at\sin\sigma) & -\sin(at\sin\sigma) \\ -a\sin\sigma\sin(at\sin\sigma) & -a\sin\sigma\cos(at\sin\sigma) \end{pmatrix}$$

and

$$\Delta(\sigma) = -2a\sin\sigma[1+\cos(aT\sin\sigma)].$$

Therefore,

ISSN 1027-3190. Укр. мат. журн., 2005, т. 57, № 8

$$N_{\Delta} = \{k\pi\}_{k \in \mathbb{Z}} \cup \left\{ \arcsin\frac{(2k+1)\pi}{aT}, -\frac{\pi+aT}{2\pi} \le k \le \frac{\pi+aT}{2\pi}, k \in \mathbb{Z} \right\}.$$

If we take $H = \mathbb{R}$, we conclude from the above theorem that problem (10), (11) is properly posed in $C^n([0, T], W_{\Omega}^{\pm\infty})$ with $\Omega = \mathbb{R} \setminus N_{\Delta}$.
